

## Spider Vein, Cherry Hemangioma and Broken Capillary Removal

Hallmark Health Cosmetic & Laser Center is pleased to offer you **laser spider vein removal** and **broken capillary removal**, a quick painless laser treatment performed by our laser certified registered nurses that eliminate unsightly **facial and leg veins**.

### Frequently Asked Questions

#### What are spider veins and what causes them?

- Spider veins are tiny clusters of broken capillaries and small reticular veins. They are called spider veins due to their appearance of blue clusters that spread out like spider legs. Spider veins may be caused by many things such as: hormones, pregnancy, overexposure to sun, genetics and the aging process. Spider veins typically occur on the face and the legs.

#### What is laser spider vein removal and how does it work?

- Laser spider vein removal is a quick laser treatment typically performed on the face or legs. It is a non-invasive treatment where the nurse delivers a few targeted laser pulses at the spider veins to be removed. Light emitted from the hand piece safely passes through the outermost layers of skin and targets the spider veins without damaging the surrounding skin. The light energy is then converted to heat and this initiates the process of removing spider vein. The treated veins will gradually fade or diminish. In many cases, smaller spider veins may be eliminated in a few treatments, medium or larger spider veins may take additional treatments. Spider veins may initially appear darker after treatment.

#### What areas can spider vein removal treatments be performed on?

- Laser treatment can be performed on small facial areas or in the lower extremities. For a short period of time following treatment, a cold compress may be applied to soothe the possible appearance of slight swelling or redness of the skin. Treatments on the face, chest, neck, hands, legs and abdomen are all done safely and quickly with laser technology.

#### What are cherry hemangiomas and how do you remove?

- Cherry hemangiomas or cherry angiomas are very small red vascular malformations that can appear on the face, neck and can be prevalent on the body. Cherry hemangiomas are microscopic blood vessels grouped very closely together at the surface of the skin. Cherry hemangiomas appear more frequently as we age. Cherry hemangiomas do not pose a health risk and are successfully treated with the laser.
- The laser treats cherry hemangiomas by focusing energy on the hemoglobin in the microscopic blood vessels forming the cherry hemangiomas. The laser heats up and closes the small blood vessels that make up the cherry hemangiomas thus eliminating it.

#### How many laser treatments will I need and what can I expect?

- Cherry hemangiomas treatments can take as little as one or two treatments or as many as six laser treatments.
- You may feel, heat, snapping or prickling sensations at the surface of the skin. The laser Treatments do not last more than a few minutes, but also depends on the number of hemangiomas you have. There is no down time associated with this treatment.

**Call (781) 213-5130 to schedule your FREE consultation today or to request more information on spider vein, hemangioma or broken capillary removal and to receive 20% off your initial laser service or complete the [contact form](#) and we will contact you by the method of your choice.**
